

MEDICATION DOSAGE REMINDER DEVICE

ABSTRACT

A medication dosage reminder device (100) operating on the exterior wall surface of a medication container (C) includes a band support (110) on the wall and a flexible band (132) continuously mounted (132m) closely around the wall of the container, above the band support. A single device is suitable for a large variety of common medication container shapes and sizes. Mating contact areas (112) (136), on the two members limit movement of the mounted band when they are selectively engaged. The mounted band is otherwise free to rotate about the container. Co-operating indicia on the device include an indicator pointer (138) and dosage time periods (120) that may be inscribed (122) to establish a highly customized dosage schedule. A patient rotates the band to indicate the next scheduled dosage time period. The indicator pointer and the scheduled dosage time period form a reminder indicating when the next dose is due or when the last dose was taken.
